(54) Title: CLARIFICATION APPARATUS FOR LIQUID

(54) 発明の名称:液体浄化装置

(57) Abstract: A clarification apparatus for liquid, characterized in that it has a first filtration layer (3) and a second filtration layer (4) and, arranged between the layers, an absorbing agent (5) comprising basic magnesium sulfate and magnesium hydroxide, wherein the liquid to be treated, and then the resulting large particles are caught by the second filtration layer (4) and wherein a liquid to be treated containing a heavy metal in its assess through the absorbing and the second filtration layer (4) and wherein a liquid to be treated containing a heavy metal in its assess through the absorbing are filtered. a liquid to be treated containing fine particles is passed through the absorbing agent (5), to thereby aggregate the fine particles in treated containing a heavy metal ion is passed through the absorbing agent (5), to thereby react the metal ion with a hydroxyl ion of the absorbing agent and solidify the metal ion, followed by aggregation, and then the resulting large particles are caught by the second filtration layer (4); and an apparatus which further has an electrode device capable of generating an OH ion, wherein the electrically generated OH ion, the OH radical of the absorbing agent (5) and the heavy meal ion react with one another, to thereby efficiently solidify the metal ion and aggregate the resultant solid into large particles, and then the resulting large particles are caught by the second filtration layer (4).
